

Standard model forcing for period 40 ka to preindustrial:

- Orbital parameters
- Coral reef regrowth
- Greenhouse gas radiative forcing
- North Atlantic freshwater input

- Land ice albedo

& changes in seven mechanisms (parameters p_i):

- Southern Ocean wind stress
- Export rain ratio
- Coral reef regrowth
- Southern Ocean air-sea gas transfer rate
- Organic matter remineralization
- Organic weathering flux

- Land carbon stock

50 Bern3D
factorial runs

60 Bern3D multi-
parameter runs

Sensitivity to
each
mechanism i
for each target T :

$$S_i^T = \frac{\partial T}{\partial p_i}$$

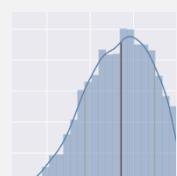

Emulator of
Bern3D results
for target T :

$$\Delta T = a^T + b^T \cdot (\sum_{i=1}^7 \Delta p_i \cdot S_i^T)$$

500 000 multiparameter runs with
emulator and uniform prior distribution

Constrain with proxy targets T

$$\delta^{13}\text{C}_{\text{DIC}} \quad \delta^{13}\text{C}_{\text{atm}} \quad \text{CO}_2 \quad \text{CO}_3^{2-}$$

Observation-constrained
change in land carbon
(Δland)
